Introduction & Construction

CAVITY FILTERS

Resonant cavity filters are the primary building blocks of duplexers, multicouplers and preselectors. However, their use is not limited to these specific applications. Individual or cascaded cavities may be used for a variety of interference fighting chores, such as cleaning up the performance of existing filter systems that have inadequate isolation or off-channel interference rejection. At crowded antenna sites, cavity filters are ideal for quieting noisy transmitters or for preventing transmitter IM mixing. Receiver frontend selectivity can be greatly enhanced by the use of additional filtering, thus eliminating many desensitization, IM, and overload problems.

When used in conjunction with a spectrum analyzer or service monitor, cavity filters can allow a detailed analysis of lower-level transmitter noise. This lower-level noise is one of the major sources of interference at multi-transmitter sites. Cavity filters can stand alone as pieces of test equipment for analyzing many receiver IM problems and can also help determine the best type of filter to use for a permanent fix.

Four types of cavity filters are designed and manufactured by TX RX Systems: Bandpass, T-Pass®, Vari-Notch® and Series-Notch®. Each uses a specific type of loop assembly which provides the desired frequency response. The Vari-Notch® and Series-Notch® filters use one loop assembly per cavity and incorporates a tuning capacitor. The Bandpass and TPass® designs utilize 2 loop assemblies per cavity.

Silver plated connectors with gold pins reduce the risk of intermod; especially at higher frequencies
Silver plated probes insure conductivity even if corrosion occurs
Nickel plated invar has high temperature coefficient and resists rust
Push/pull tuning (not threaded) mechanism stays on frequency when locked down.
Temperature compensation stem keeps cavity on frequency
Slotted probe fingers insure excellent contact between stationary and moveable probes
Heliarc welded end cap = one piece construction which maximizes 'Q'
Field adjustable loops allow changes in selectivity as well as circuit style
Fine tuning rod provides an easy way to optimize tuning

Theory of Operation and Applications

Various Low-Loss High-Rejection Models to Choose From

All Loop Plate/connector assemblies are silver-or Alballoy®-plated for low IM

Welded cavity construction and silver-plated tunable probe and loops give superior pass and reject characteristics

BANDPASS

T-PASS®

T-Pass® is a variation of the Bandpass cavity used for our expandable multicoupler applications. Its general characteristics are nearly identical to a bandpass cavity but the output loop has a pair of N-connectors so it can easily be coupled to other channels.

SERIES NOTCH®

The Series-Notch® passes a relatively wide band of frequencies while rejecting a very narrow band of frequencies. It is equivalent to a series-tuned circuit. Notch depth is variable from 15 - 25 dB. Pass and notch frequencies must be known so that the optimum loop assembly can be used. This is the best filter for very close separations (200 KHz to 400 KHz) in UHF applications.

VARI-NOTCH®

The Vari-Notch® design passes a relatively narrow band of frequencies and rejects (notches out) a relatively wide frequency band. Equivalent to a combination series-tuned and parallel-tuned circuit, this filter has a greater notch depth than the Series-Notch® design. The notch depth is adjustable but varies with passband insertion loss (0.3dB or 0.6dB typical) and the difference between pass and notch frequencies. Vari-Notch® is ideal for moderately close to wide separations (400 KHz and greater) in UHF applications.

CASCADING FILTERS

All cavity types mentioned above may be cascaded to achieve an arithmetic sum of individual filter attenuation. Up to 6 dB of additional attenuation can be achieved when the proper length of cable is used to interconnect the cavities. (This additional 6 dB does not occur in the filter passband but only at frequencies where moderate to high attenuation occurs.) A TX RX system specialist can assist you in ordering the proper length of interconnecting cable for your frequencies.

CAVITY FILTERS Loop Kits

BTG, TX RX Systems cavity filter loop kits allow the same cavity shells to be configured for different responses in order to suit different application needs. See page 2 of this section on descriptions of the various filter configurations.

DUPLEXERS

30-960 MHz

A Duplexer (or diplexer as they are sometimes called) is a 3-port device most commonly used to allow a transmitter and receiver, operating on different frequencies, to share a common antenna while operating simultaneously. The filters that make up the duplexer isolate the transmitter from the receiver by doing two important functions - the most important is filtering out any transmitter noise sidebands that are being generated on the receive frequency. The second function is protecting the receiver from transmitter carrier overload. The amount of isolation necessary is dependent upon the TX to RX frequency spacing. As the frequencies get closer, a higher value of isolation is required.

At high-band VHF and UHF, the TX RX Vari-Notch® design is the most commonly used. Vari-Notch® provides a low-loss pseudo-bandpass characteristic that can exist very close to a deep notch. Proven low-loss and low-noise construction techniques are used such as welded cavity construction; silver-plated loops, Alballoy®-plated integrated loop plates and connectors; as well as a unique fingerstock-free high-conductivity silver-plated tuning probe. Our 4" and 6.625" diameter cavities are constructed of hardened aluminum which, unlike most copper cavities, resists denting and associated detuning.

At 700/800/900 MHz where there are large guard bands and multiple frequencies per system, the Bandpass duplexer fills the bill nicely. The combline filter design is both low-loss and space-efficient. For duplexing a single repeater, the TX RX Vari-Notch® design is still the product of choice. Vari-Notch® provides a low-loss pseudo-bandpass characteristic that can exist very close to a deep notch. Proven low-loss and low-noise construction techniques are used such as welded cavity construction; silver-plated loops, Alballoy®-plated integrated loop plates and connectors; as well as a unique fingerstock-free high-conductivity silver-plated tuning probe. Our cavities are constructed of hardened aluminum which, unlike most copper cavities, resists denting and associated detuning.

Insertion Loss: Tx Loss/Rx Loss

DUPLEXER PROBLEMS AND REMEDIES

Duplexers are passive devices requiring little or no service once installed in a system. The proper design and application of a given Duplexer will give years of trouble free service. When problems do occur in a duplex system it is necessary to identify as many abnormal conditions as possible to zero in on the specific cause of the problem. Unfortunately, there are only a few measurable or observable performance indicators at the disposal of the field serviceman, and any number of conditions may exist, even simultaneously, which are responsible for the observed phenomena. Most Duplexer installation problems fall into three categories. Each of these three conditions will be treated separately, using the typical cause and remedy approach.

KEY

- A. High Input VSWR
- **B. Excessive Loss**
- C. Desensitization of the receiver when transmitter is keyed.

PRO	PROBLEM		POTENTIAL CAUSE								
Ā		С	THE NUMBER AT RIGHT CORRESPONDS TO THE REMEDY PARAGRAPH ON THE NEXT PAGE.								
•	•		Reverse labeling of Tx and Rx terminals.	1							
•	•		Unit tuned to wrong frequencies.	2							
•			Bad antenna or interconnect cables.	3							
•	•		Use of between series adapters, especially UHF types.	4							
•	•	•	Duplexer detuned in shipment.	5							
•	•		Water has entered the Duplexer antenna connector from the antenna feed line.	6							
•	•		Spurious Tx output is being reflected by the selective Duplexer input terminal and observed on the wattmeter, the wattmeter being unable to discriminate between on-frequency and off-frequency energy.	7							
		•	Bad joint in a cable or antenna system beyond the antenna terminal of the Duplexer. All lines may show zero reflected power, but noise can still be produced when a corroded or indefinite metal-to-metal contact is exposed to RF energy. When this occurs beyond the Duplexer, it cannot be filtered out, and the noise backs up into the receiver.	8							
		•	Adverse cable length between Duplexer and transmitter using varactor or broadband hybrid combining type transmitter outputs. Even though the Duplexer VSWR is flat on frequency, the reflected impedance of the Duplexer off resonance, transformed by changing cable lengths, can cause parasitics to be generated.	9							
		•	Duplexer transmitter mixing with another outside transmitter, producing intermodulation on or near the receiver frequency.	10							
		•	Transmitter cable leading to Duplexer in close proximity to Duplexer antenna or receiver cable. This is usually only a problem on close separation Duplexers, (1.0 MHz or less) where the 85 to 100 dB isolation is decreased by adverse coupling, created by running these cables too close together for too great a distance.	11							
		•	Inadequate shielding of transmitter and receiver modules in the repeater.	12							
		•	Insufficient duplex isolation for the application.	13							
		•	A spurious transmitter response outside of the normal Duplexer isolation band or inadequacy of notch filter type Duplexers to suppress a wide enough band of Tx noise to protect the receiver.	14							
		•	Impedance change in antenna due to icing. VSWR increase may be sufficient to reflect back through the Duplexer and upset transmitter tuning, causing parasitics, which are not suppressed sufficiently by the Duplexer.	15							
		•	The addition of a broadband power amplifier to a low power transmitter. The noise floor of the low power radio is raised by an amount equal to the gain of the power amplifier, and in addition, the power amplifier will contribute its own noise. Power amplifiers are just as prone to the generation of parasitics as transmitters, and may be triggered by an adverse cable length between power amplifier and Duplexer, a problem covered above.	16							
		•	Excessive loss with changing temperature and apparent Duplexer detuning.	17

Duplexer Trouble Shooting Aid

FIELD SERVICE REMEDIES FOR PROBLEMS LISTED ON PREVIOUS PAGE

- 1. Tune a signal generator to the receive frequency and inject it into the antenna terminal, sampling for the signal at each equipment terminal. Reverse the labels if necessary. It may be that the unit was ordered to the reverse frequencies. If so, the label will indicate this. If the duplexer is symmetrical in design (usually indicated by the same number of Tx and Rx filter sections) just reverse the equipment labels and operate. Generally, no damage will be done to the duplexer when operated in reverse for a short time period. If other adverse symptoms appear, contact the factory.
- 2. Check the unit label. If needed, the duplexer may be field tuned. Consult the instructions and/or the factory if the duplexer is still under warranty or beyond field tuning capability.
- 3. Check cable, by substitution, using a termaline wattmeter. or a thruline wattmeter into a known good load. Check the antenna line input for reflected power.
- 4. To eliminate high input VSWR reduce the number of between series adapters by making up proper interconnect cables. UHF connectors are non-constant impedance, and certain combinations can transform a 1.1:1 VSWR into a 2.0:1, or vice versa.
- 5. Consult the instruction manual for field tuning procedures, or the factory, if the unit is still under warranty or beyond field tuning capability. (We trust that our products will not be prone to this problem).
- 6. Consult the factory. The affected antenna cables may be field replaceable, or a "baking out" process may be possible.
- 7. To prove this condition, place a bandpass filter between the Tx and duplexer to clean up the spurious, and put the wattmeter between the bandpass filter and the duplexer to measure reflected power from the duplexer. The bandpass filter selectivity should be equal to or better than that of the duplexer at about the 3.0 dB points.
- 8. Operate the duplex system into a dummy load. If no desensitization occurs, check out all lines, antennas, and look for potential bad joints close to the radiating antenna where re-radiation of noise may be possible back into the antenna system receiver. Loose metal-to-metal contacts on tower guying systems have also been known to create system noise. Note the effect of vibrating tower guys on system
- 9. Change the length of cable between the transmitter and duplexer, traversing through a half wave in increments of between 1 and 2 inches until the desensitization ceases or is minimal. A ferrite isolator will also cure this condition when it is installed between the transmitter and duplexer. However, this is a much more expensive remedy.

- **10.** If the IM is in the duplex transmitter, a ferrite isolator in the duplex transmitter line (NOT antenna line) will show this by either reducing or eliminating it. More isolation can be obtained by cascading isolators if needed. However, IM of this magnitude indicates the system should be studied for possible revision to reduce the production of this IM.
- 11. Cables such as RG-8a/u and RG-213/u should be kept at least 3-4" apart over 5'-10' runs. Use of double shielded cable will reduce the susceptibility to this problem.
- **12.** Consult the radio manufacturer. This condition can be verified by operating the transmitter into a dummy load while injecting a minimum quieting signal into the receiver. Some radios require special modifications before they are suitable for repeater operation.
- 13. If this problem is suspected, contact the radio manufacturer for recommended duplex isolation for Tx noise suppression and carrier suppression. Duplexer isolation should be measured first per instruction manual to verify rated specifications are present. If more duplex isolation is required, contact TX RX SYSTEMS for recommended filtering.
- 14. Consult the factory. Bandpass filter tests can be made to confirm this. In extreme cases, adjustments to the transmitter may be required.
- 15. Either de-ice the antenna, or use an antenna less sensitive to ice. A ferrite isolator can also be put at the transmitter output to improve the impedance match. Ferrite isolators cannot be put in antenna lines, as they will attenuate Rx signals.
- **16.** A mismatch may possibly be reduced by lengthening the cable which runs between the power amplifier output and the duplexer input until the receiver desensitization disappears, as follows:

30 MHz to 512 MHz RANGE

BNC or N type adapters may be inserted in the original cable, one at a time and not to exceed a total of 1/2 wavelength, until desensitization disappears.

800 MHz to 1.3 GHz RANGE

Prepare a cable length 3/4" longer than the original cable and insert. If desensitization does not disappear, repeat with cables each 3/4" longer than the previous length, not to exceed 1/2 wavelength.

17. We find that this cause most commonly relates to shifting impedance of the transmitter or power amplifier with temperature. The duplexer appears detuned, since a "conjugate match" (canceling reactance, and matching resistance component) is approached by shifting the duplexer passband above or below the 50 ohm point, as determined by an increase in output power on the wattmeter. In this case, temperature control of the room is the only answer, other than upgrading the transmitter.

ISOLATION CURVES FOR DATA REFERENCE TRANSMITTER/RECEIVER

The curves shown below for use with filters, duplexers, and multicouplers, indicate the amount of isolation or attenuation required between a typical 100 watt transmitter and its associated receiver at the Tx (carrier suppression) and Rx (noise suppression) frequency which will result in no more than a 1 db degradation of the 12 db SINAD sensitivity.

Note: These are only "typical curves. When accuracy is required, consult the radio manufacturer.

REFERENCE

Loss Nomographs

BTG, TX RX Systems offers this convenient means of determining ten insertion loss of Filter, Duplexers, Multicouplers, and related products. It should be remembered that the field accuracy of wattmeter readings is subject to considerable variance due to RF connector VSWR and basic wattmeter accuracy, particularly at low end scale readings. However, allowing for these variances, this graph should prove to be a useful reference.

For lower power levels, divide both scales by 10 (5 to 50 watts)

For other power levels, multiply both scales by the same multiplier

INSERTION LOSS (Db) INPUT POWER (WATTS) **OUTPUT POWER (WATTS)**

REFLECTED POWER (WATTS)

CONVERSION TABLE

POWER AND VOLTAGE RATIOS TO dB

TO ACCOUNT FOR THE SIGN OF THE DECIBEL

For positive (+) values of the decibel - Both voltage and power ratios are greater than unity. Use the two right hand columns. For negative (-) values of the decibel - Both voltage and power ratios are less than unity. Use the two left hand columns.

FORMULA: Path Loss (dB) = 36.6 + 20 log (MHz) + 20 log (miles)

Bird® Technologies Group (BTG) is a global, innovative supplier of RF products, systems, services and educational solutions. Combining the industry leading brands of both Bird Electronic and TX RX Systems in one company reinforces the BTG commitment to providing RF Measurement and Management in Your World.

Our portfolio includes hardware, software, components and services. We offer these innovative products and services through our industry leading product line brands, Bird Electronic Corp and TX RX Systems. We provide test instruments that are highly accurate, rugged and easy to use. Industry leading components and products such as site analyzers, wattmeters, digital sensors, samplers, antennas, signal boosters, and tower mounted amplifiers. Furthermore, we offer dependable engineering, calibration and educational services for land mobile radio, cellular, semiconductor, broadcast, medical, military and government applications.

All BTG products can be serviced and calibrated by the Bird Service Center (BSC). BSC provides a full range of service and support. With over 130 years of combined product and calibration experience, our service technicians and product experts offer reliable service and customer care. Bird Service Centers and Service Partners are located World Wide providing a full range of service and support for your Bird Products.
